

Synca — Executive Summary

Confidential — For Investor Use Only

May 2026

The Problem

Dating apps are broken — not because there are too few people on them, but because they surface the wrong ones. The dominant swipe model generates volume, not quality. Nearly 79% of Gen Z users report burnout from endless swiping, 27% of social mentions about dating apps are negative, and the post-match experience — deciding what to do, where to go, when to meet — fails almost as often as the match itself.^{[1][2]}

Beneath the UX problem lies a deeper structural flaw. Current matching relies entirely on self-reported data: photos, bios, stated preferences. These capture how people want to be seen, not how they actually live. Two people can share interests on paper but run on completely different biological clocks, travel with opposite philosophies, and listen to music that signals entirely different emotional profiles — incompatibilities discovered only after meeting. Compounding this, fake profiles, escort accounts, and inauthentic users pollute every major platform with no effective systemic solution.^{[3][4]}

The Solution

Synca is a precision matchmaking platform that builds a **multi-signal lifestyle compatibility profile** for each user from passive, continuous, objective data sources — and proposes one **highly curated match at a time**, already paired with a pre-organized date.

The Signal Stack

Synca progressively combines five categories of lifestyle signals:

1. Health biometrics (*core, MVP*)

Sleep patterns, activity rhythms, peak energy windows, routine consistency, and recovery behavior — read from Apple Health (iOS) and Health Connect (Android). Passive, continuous, and structurally difficult to fake.

2. Visual preference inference (*core, MVP*)

An onboarding game powered by AI-generated archetypes builds a personal preference embedding from each user's spontaneous visual choices. The system learns aesthetic and lifestyle affinities implicitly — without requiring users to declare explicit filter preferences.

3. Photo context analysis (*core, MVP*)

AI analysis of uploaded photos evaluates contextual signals — setting, style, activity type,

lifestyle cues — rather than physical attributes. This feeds both the compatibility engine and the trust scoring system.

4. Travel behavior (*post-MVP v1*)

Integration with travel services (Polarsteps, Google Maps Timeline, onboarding travel preference game) reveals how often someone travels, how far, and whether they seek new experiences or return to familiar places. One of the strongest predictors of long-term lifestyle compatibility.

5. Music listening profile (*post-MVP v1*)

Spotify API integration exposes audio features — energy, valence, diversity, tempo — and listening time patterns. Music correlates deeply with personality and emotional profile, and listening time patterns independently validate and reinforce health data signals (e.g., relaxing music at 22:00 confirms the HealthKit-derived sleep onset time).

Each new signal layer deepens the compatibility model, increases trust score accuracy, and strengthens the defensibility of the matching engine over time.

Key Product Features

One Match at a Time

Synca does not present an infinite feed. The algorithm works in the background and surfaces a match only when conditions — health compatibility, visual preference alignment, geographic overlap, authenticity score — are genuinely met. Users receive a small curated batch (ideally one person) rather than hundreds of profiles to evaluate.

Pre-Organized Date Proposals

After a match, Synca eliminates the most common post-match failure point: decision paralysis. The system generates 1–3 concrete date proposals based on both users' energy peaks, sleep schedules, geographic proximity, and activity preferences. Users choose from options rather than negotiating from zero.

Selective Ghosting System

Profiles showing patterns consistent with inauthenticity — escort behavior, fake health data, photo contexts strongly correlated with transactional intent — receive progressively reduced visibility without notification. A multi-layer Trust Score (liveness detection, photo forensics, behavioral signals, health data quality, music and travel data consistency) maintains community quality automatically.^{[4][5][^3]}

Onboarding Preference Game

A short visual game using AI-generated person archetypes builds each user's preference embedding implicitly. No explicit category filters. The system infers genuine attraction patterns from spontaneous choices — patterns that users themselves may not have consciously articulated.

Live In-Person Game

Two people who meet physically — at a gym, sauna, or social event — can open Synca and start a shared live session. In under three minutes they complete a synchronized compatibility

mini-test, see an instant compatibility snapshot, and receive a first date proposal. Every live session produces two fully onboarded users simultaneously, turning physical presence into an organic acquisition channel.

Architecture

- Native apps aggregate health data on-device. Raw samples never reach the server — only anonymized summaries.
- Rails API runs all matching logic, trust scoring, date proposal generation, signal enrichment, and premium access management. Single backend serving all client surfaces.
- Telegram Bot / Mini App serves as the primary acquisition funnel, notification layer, and payment interface — critical for Russia where Telegram penetration reaches 64.4%.^[6]
- External payment page processes all transactions outside App Store / Google Play, eliminating the 30% platform commission. Legally permissible under EU Digital Markets Act (2024); standard practice in Russia, Thailand, and UAE.

Market Opportunity

The global dating app market is valued at \$11.61 billion in 2025, projected to reach \$24.85 billion by 2035 (CAGR 7.91%). The AI-curated matchmaking segment is the fastest-growing subsector, with \$30M+ invested in 18 months across comparable startups — all without health data, all US-only.^{[7][8][9][10][11]}

Competitor	Model	Funding	Gap vs Synca
Keeper	AI + human matchmaker	\$4M ^[8]	No health/travel/music data, US only
Known	AI + in-person dates	\$9.7M ^[10]	No health/travel/music data, US only
Sitch	Pay-per-match	\$6.7M ^[11]	No health/travel/music data, US only
Ditto	AI, no swipe	\$9.2M ^[9]	No health/travel/music data
Hinge	Curated mainstream	\$550M+ revenue ^[12]	No objective data, swipe model

No existing competitor combines objective health biometrics, travel behavior, music profile, visual preference inference, and pre-organized dates in a single platform — across international markets.

Seven-City Launch Map

City	Key Driver	Wave
Moscow 🇷🇺	Post-Tinder vacuum[^13], +25.3% dating audience 2024[^14], Telegram 64.4%[^6]	1
Bangkok 🇹🇭	Extreme fake/escort problem[^15], expat community, 20%+ daily users 25–34[^16]	1
Dubai 🇦🇪	Smartwatch penetration 33.4% globally highest[^17], premium fitness culture[^18]	1
Seoul 🇰🇷	Premium niche app culture[^19], demographic crisis driving demand[^20]	2
Milan 🇮🇹	iOS-dominant premium users, fitness culture, GDPR-native	2
São Paulo 🇧🇷	Largest Latin America dating market \$420M[^21]	3
Mexico City 🇲🇽	#1 city globally for Tinder Passport usage[^22]	3

Business Model

Premium Subscription — €12–15/month. Free tier: health dashboard, onboarding games, limited match visibility. Premium: full match access, complete compatibility breakdown, date proposals, signal enrichment (Spotify, travel). All payments via Telegram or external web page — zero App Store commission.

Pay-per-Match / Date Pack — Curated match or ready-made date experience purchased individually. Validated by Sitch's \$30–90 per pack model.[^11]

B2B Venue Partnerships — Gyms, saunas, padel courts, and cafés integrated into the date proposal system. Synca drives structured traffic; venues offer preferential rates packaged as "date packs." Venues also serve as offline acquisition channels.

Commission-Free Payment Infrastructure — Telegram Stars, YooMoney, SBP (Russia), Stripe via external link. Zero platform commissions across all markets.

Go-To-Market

Community-first, city-by-city. Each city treated as an independent laboratory:

1. Identify 2–3 micro-communities (run clubs, gyms, saunas) with high wearable penetration
2. Partner with community organizers as local ambassadors
3. Host invite-only seeding events — entry requires completing onboarding. One event = 50–150 fully profiled users
4. Physical manifests in gyms, saunas, and fitness spaces with city-specific QR codes linking to Telegram Bot
5. Activate match engine only after reaching minimum density (~300–500 active users per city)
6. Launch B2B venue partnerships within 8 weeks of city activation

In Russia, the Telegram Bot is the primary acquisition channel — organic and viral within existing Telegram communities.

Why Now

Three macro trends converge at this precise moment:

- **Swipe fatigue is peaking:** 79% of Gen Z reports dating app burnout; Bumble lost 19% of downloads in 2024; the market is actively searching for alternatives.^{[23][1]}
- **Health and lifestyle data infrastructure is mature:** Apple HealthKit has 89M active users; Health Connect replaces Google Fit as Android standard in 2026; smartwatch penetration growing at 17.2% CAGR globally; Spotify has 675M+ users with a developer API ready for integration.^{[24][25][^26]}
- **AI-curated matchmaking is being funded internationally:** \$30M+ in the segment in 18 months — all US-only, all without health or lifestyle data signals. The international opportunity with a full lifestyle signal stack is entirely open.

Signal Expansion Roadmap

MVP	Post-MVP v1	Post-MVP v2	v3
✓ Sleep & activity health data	+ Spotify integration	+ Google Maps Timeline (travel behavior)	+ Cross-signal validation
✓ Visual preference game (AI archetypes)	+ Travel preference game	+ Deep audio features (Spotify)	(health ↔ music) ↔ travel fusion
✓ Photo context AI	+ Basic travel signals	+ Multi-source trust scoring upgrade	+ Predictive compatibility modeling
✓ Geolocation	+ Apple Music support		
✓ Telegram Bot + payment infra			

Traction & Status

- Product architecture fully defined across all layers (iOS, Android, Rails backend, Telegram Bot, payment infrastructure)
- Repository initialized as monorepo (iOS app, backend API, documentation)
- iOS MVP in active development: HealthKit integration, sleep/steps aggregation, local compatibility engine, preference onboarding game, mock matching deck
- Matching model defined: weighted scoring across 8 dimensions (sleep, peak activity, routine stability, activity level, personal space, recovery, travel style, music profile)
- Market analysis completed across 7 cities with competitive landscape and city-specific go-to-market
- Telegram architecture and payment infrastructure scoped for Russian market launch
- Yandex AI integration scoped for photo context analysis (Moscow Wave 1)

The Ask

[To be completed: funding amount, use of funds, valuation, and terms.]

Priority use of seed capital: engineering team (Android developer + backend engineer), Moscow community seeding events and venue partnerships, Yandex AI and Spotify API integrations, and 6-month runway to first-city product-market fit validation.

Full documentation package available upon request: Litepaper, Technical Whitepaper, Detailed Market Analysis (7 cities), Financial Projections.
